

Device Object

WIDGET API VERSION 1.4.0

The `device` global object provides information about the device the widget is currently displayed on. Automatically available in the JavaScript context of every widget.

Properties

Property	Type	Description
<code>deviceId</code>	<code>string</code>	Unique identifier of the device displaying the widget (UUID without braces)

```
console.log(device.deviceId); // "a1b2c3d4-e5f6-7890-abcd-ef1234567890"
```

Usage

The `device` object is used when a widget or plugin needs to identify the specific device it is running on — for example, to subscribe to device-specific events.

Pass `device.deviceId` to plugin methods that require a device identifier:

```
pluginDeviceactionproviderEvents = {  
  "onInitialized": function () {  
    window.plugins.Deviceactionprovider.initDevice(device.deviceId);  
    window.plugins.Deviceactionprovider.dialTriggered.connect(onDialTriggered);  
  }  
};
```

Availability

The `device` object is injected by iCUE before the widget's scripts execute. It is safe to access `device.deviceId` at any point after the page loads, including before `onICUEInitialized` fires.
